

DOLPHIN MEAT: TOXIC WASTE FOR LUNCH

More than 20,000 dolphins are slaughtered annually in Japan. Dolphin meat contains large quantities of methyl mercury, a powerful toxin linked to brain damage, genetic birth defects, and death.

The methyl mercury found in dolphin meat is significantly higher than the levels that resulted in the deaths of nearly 2,000 people in Minamata in the 1950s. Contaminated dolphin meat is sold in markets, but even worse, rural schools are serving this poisoned meat to children for lunch!

SEA SHEPHERD DEFENDS THE CHILDREN AND DOLPHINS

Sea Shepherd has stationed several dedicated female activists in Japan to seek an audience with the Minister of Health, bring attention to the imminent threat posed by mercury-contaminated dolphin meat to children, and express concern for the dolphins slaughtered in Japanese waters. Please join them in their efforts—urge the Japanese government to stop the slaughter and stop feeding mercury-contaminated dolphin meat to school children.
