

Did you know that dairy cows suffer to produce milk, cheese, yogurt and ice cream?

Dairy cows are artificially inseminated. Their calves are taken from them at a day or two of age, leaving cows bellowing and grief stricken. Milk meant for calves is sold for human consumption.

To produce six times the normal amount of milk, cows are fed large doses of hormones. Several times a day their udders are attached to electronic milking machines that can cause lesions, electrical shocks. The hormones and machines can produce mastitis (swollen, painful, udders).

Most dairy cows spend their lives either standing in mud or on concrete floors, always surrounded by clouds of flies. Their only respite from the annoyance and bites is switching their tails which causes feces and mud to be sprayed on humans during milking. So, their tails are docked by various painful methods without any anesthetic.

When the mother's milk is depleted she is again artificially inseminated and again suffers the grief of losing her calf. This cruel and debilitating process continues until her productivity declines when she is shipped to slaughter, her spent meat used for fast-food burgers. Dairy cows live short miserable lives of two to five years, compared to a possible life span of 15 to 20.

On organic farms, antibiotics are used sparingly to maintain "drug-free" status, thus causing more suffering due to untreated injuries or illness. ALL dairy cows end up in the same slaughterhouses.

For the cows, end this abuse...**GO VEGAN!**
Treat ALL God's creatures with
compassion and dignity...
